

Hodoscope & NIM Handbook

NMSU Nuclear Physics Group

E1039/SpinQuest Experiment
November 29, 2022

SpinQuest Spectrometer Layout

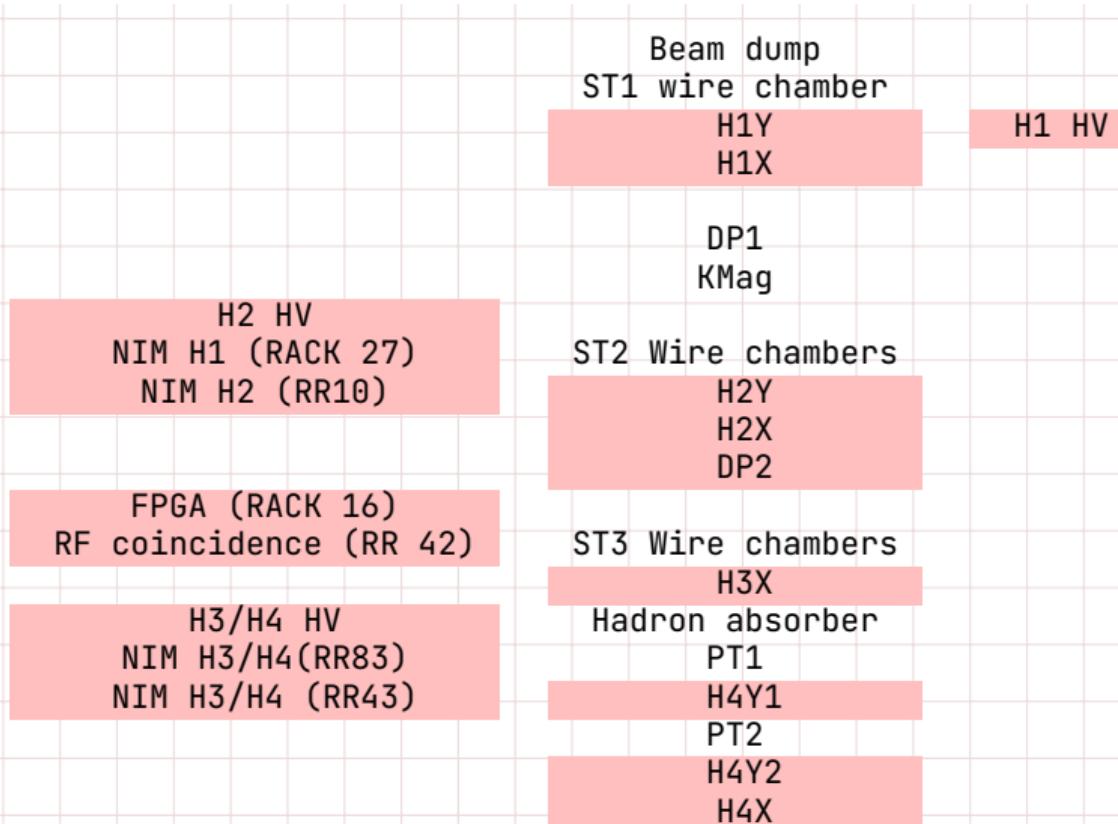

Table 1: Block diagram of the SpinQuest spectrometer. Pink shaded blocks are in the Hodoscope/NIM sub-system.

Debugging Hodoscope/NIM Sub-System

Some common steps of debugging Hodoscope/NIM sub-system includes;

- » Check the hodoscope hits in online monitor.
- » Check the raw signal from the hodoscopes.
- » Check the output signal from the discriminator.
- » Check the raw NIM signal.
- » Check the RF gated signal.

Order of these steps might change depending on the type of the issue.

Replacing Electronics

- » When replacing 4413 discriminators make sure to;
 - » keep the module threshold at the minimum. Typically this is ~ -15 mV.
 - » adjust the width to $\sim 15 - 20$ ns.
- » When replacing LEMO cables (or any cables) make sure that they are in the same length and they have correct labels in the both ends of the cable.

NIM Signal

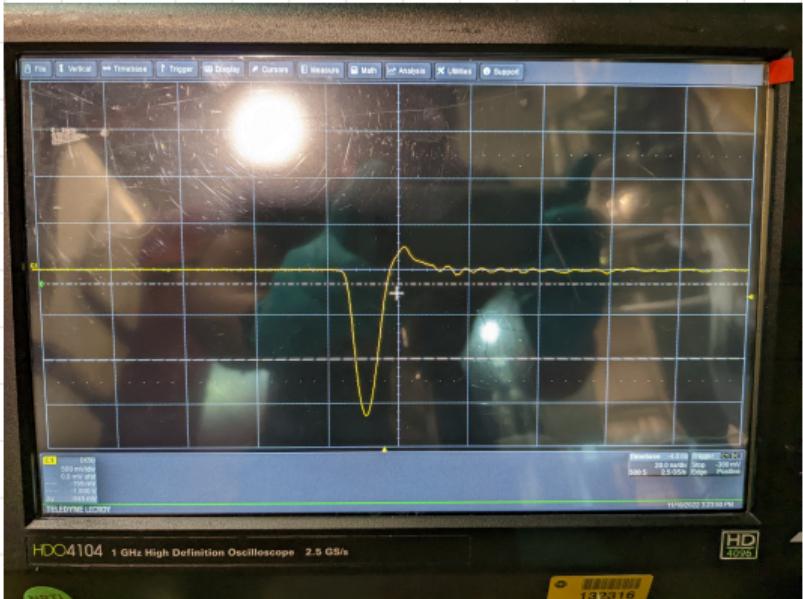

Figure 1: Typical raw signal from the hodoscope paddle. Time scale 20ns/div. and voltage scale 500mV/div.

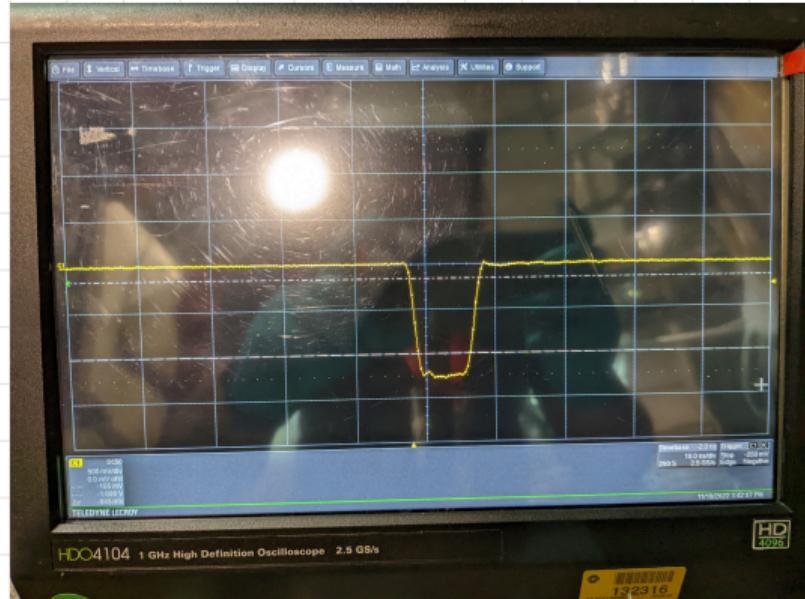

Figure 2: Typical NIM output signal from the LeCroy 4413 discriminator. The threshold of the discriminator set for the minimum value ($\sim -15\text{mV}$) and the width is set to $\sim 15\text{ns}$. Time scale 10ns/div. and voltage scale 500mV/div.

Electronics

Mostly used electronics in the NIM sub-system include.

- » LeCroy Model 4413: a 16-input discriminator in a single-width CAMAC module. Info.
- » LeCroy Model 623B: a low cost eight channel discriminator featuring high-sensitivity, high-speed, updating performance. Info.
- » LeCroy Model 4416 ECL/NIM/ECL: The Model 4416 is simultaneously an ECL-to-NIM and a NIM-to-ECL converter, specially designed to fill the gap between the new growing ECL circuitry and the old NIM electronics. Info.
- » LeCroy Model 1440 system: This is the high voltage system for the hodoscopes. Info.
- » For general infomations about NIM electronics link.

9	8	16

Table 14: H4 up PMT channel mapping to 4413 discriminators. Each color represent one discriminator. This is located at RR83 rack.

NIM Triggers

» Four NIM triggers were used with cosmic rays;

NIM1: (H1X || H1Y) && (H2X || H2Y) && (H3X || H4Y1) && (H4X || H4Y2)

NIM2: (H1X || H1Y) && (H2X || H2Y)

NIM3: Random

NIM4: (H2X || H2Y) && (H4X || H4Y2)

FPGA5: ((H1X || H1Y) && (H2X || H2Y)) || ((H2X || H2Y) && (H4X || H4Y2)) // Made with NIM modules. Time adjustment is reversed beamlike. RF timing is not included.

» Four fold NIM trigger will use in the beam time;

TRIGGER: H1X && H2X && H3X && H4X

RF Timed Trigger

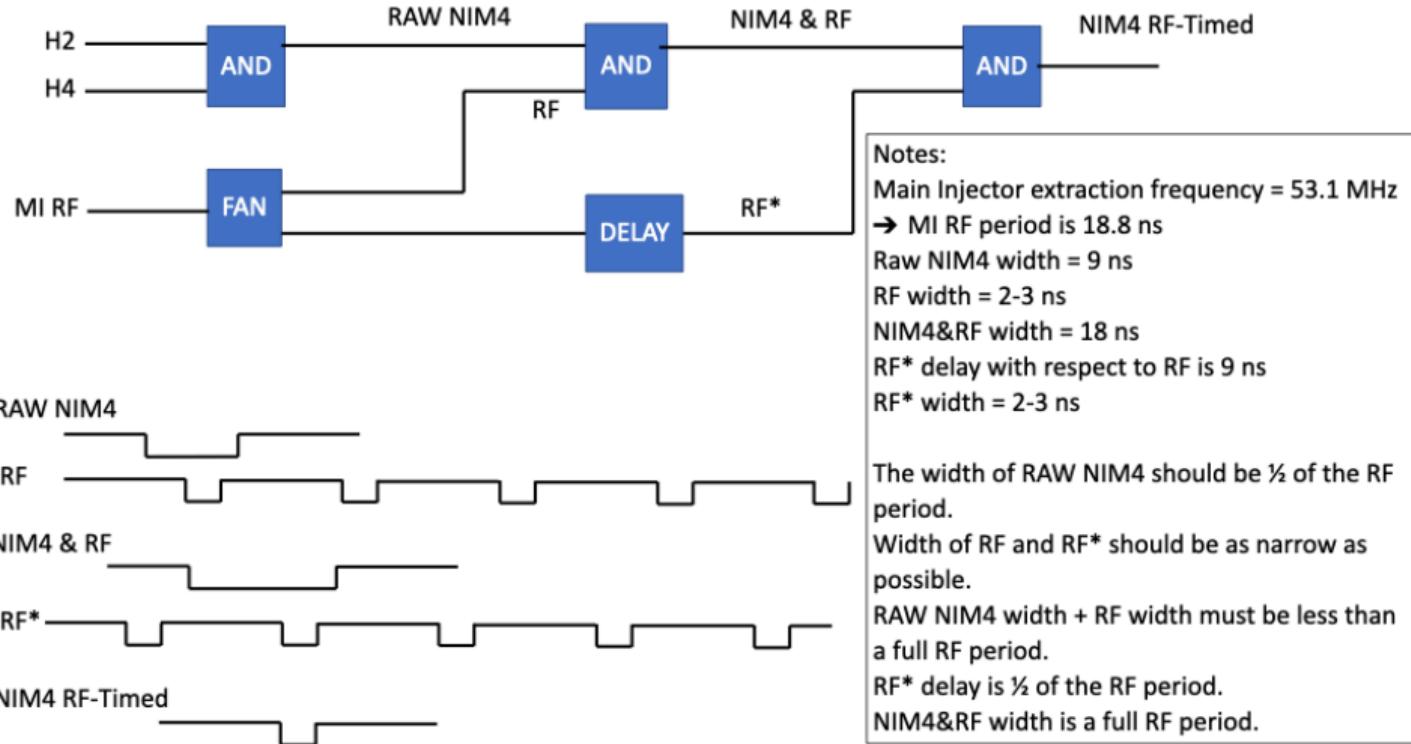

Figure 4: RF timed NIM trigger (Thanks to S. Pate).

Hodoscope Voltage Debugging

- » Navigate to settings folder use the following commands;

```
kinit user@FNAL.GOV
```

```
ssh -X user@spinquestgpvm01.fnal.gov
```

```
cd /data2/e1039/daq/slowcontrols/lecroy/hv/
```

- » Use the following commands for basic debugging;

```
./status plane # check status of plane
```

```
./on plane # turn on the hodoscope plane
```

```
./off plane # turn off the hodoscope plane
```

```
./monitor plane # check the status of the plane
```

```
./reset_netrs232.sh -y plane # reset the connection
```

Hodoscope Efficiency Software

- » Efficiency of each hodoscope paddle can be calculated using finding the straight line fit. Git repository.
- » Using reconstructed elements use repository.
- » Follow the instructions in README file to calculate the efficiencies.

Updating this Notebook

- » You can update the notebook by making a pull request to the git repository.
